# RESPONSIVE WEB DESIGN II

## Lecture 9

---

# TODAY'S TOPICS

- Image Optimization
- Responsive Images
- **Exercise:** Picture This!

---

# ANNOUNCEMENTS

- Sign-in Sheet
- Recordings
- Midterm Project

**QUESTIONS**

# IMAGE OPTIMIZATION

---

# IMAGES ON THE WEB

- Images often account for most of the downloaded bits on a web page
- Image optimization is the process of eliminating, replacing or decreasing the size of an image while still maintaining quality and visual appeal

---

# ELIMINATING / REPLACING IMAGES

- Confirm that an image is necessary or serves a purpose
- Can the image be replaced using HTML, CSS, and / or JavaScript
  - web fonts
  - CSS effects (gradients, shadows)
  - web animations

---

# DECREASING THE SIZE OF IMAGES

- Vector or Raster
- Image format
- Image resolution
- Image compression

---

# RASTER IMAGES

- **Raster images** are created using a series of pixels placed in a rectangular grid
- **Raster images** are not resolution independent
- **Raster images** work best for complex image like photos
- Common formats: GIF, PNG, JPEG, WebP

---

# GRAPHIC INTERCHANGE FORMAT (GIF)

- Universally supported
- Lossless compression
- Limited to 256 colors
- Supports animation
- Used for very simple graphics and animation

---

# PORTABLE NETWORK GRAPHICS (PNG)

- Replacement for GIF
- Universally supported
- Lossless compression
- Supports Transparency
- Used for simple graphics, icons, and illustrations

---

# JOINT PHOTOGRAPHIC EXPERTS GROUP (**JPEG**)

- Universally supported
- Lossy compression
- Supports wide range of colors
- Maintains small file size
- Used for photography

---

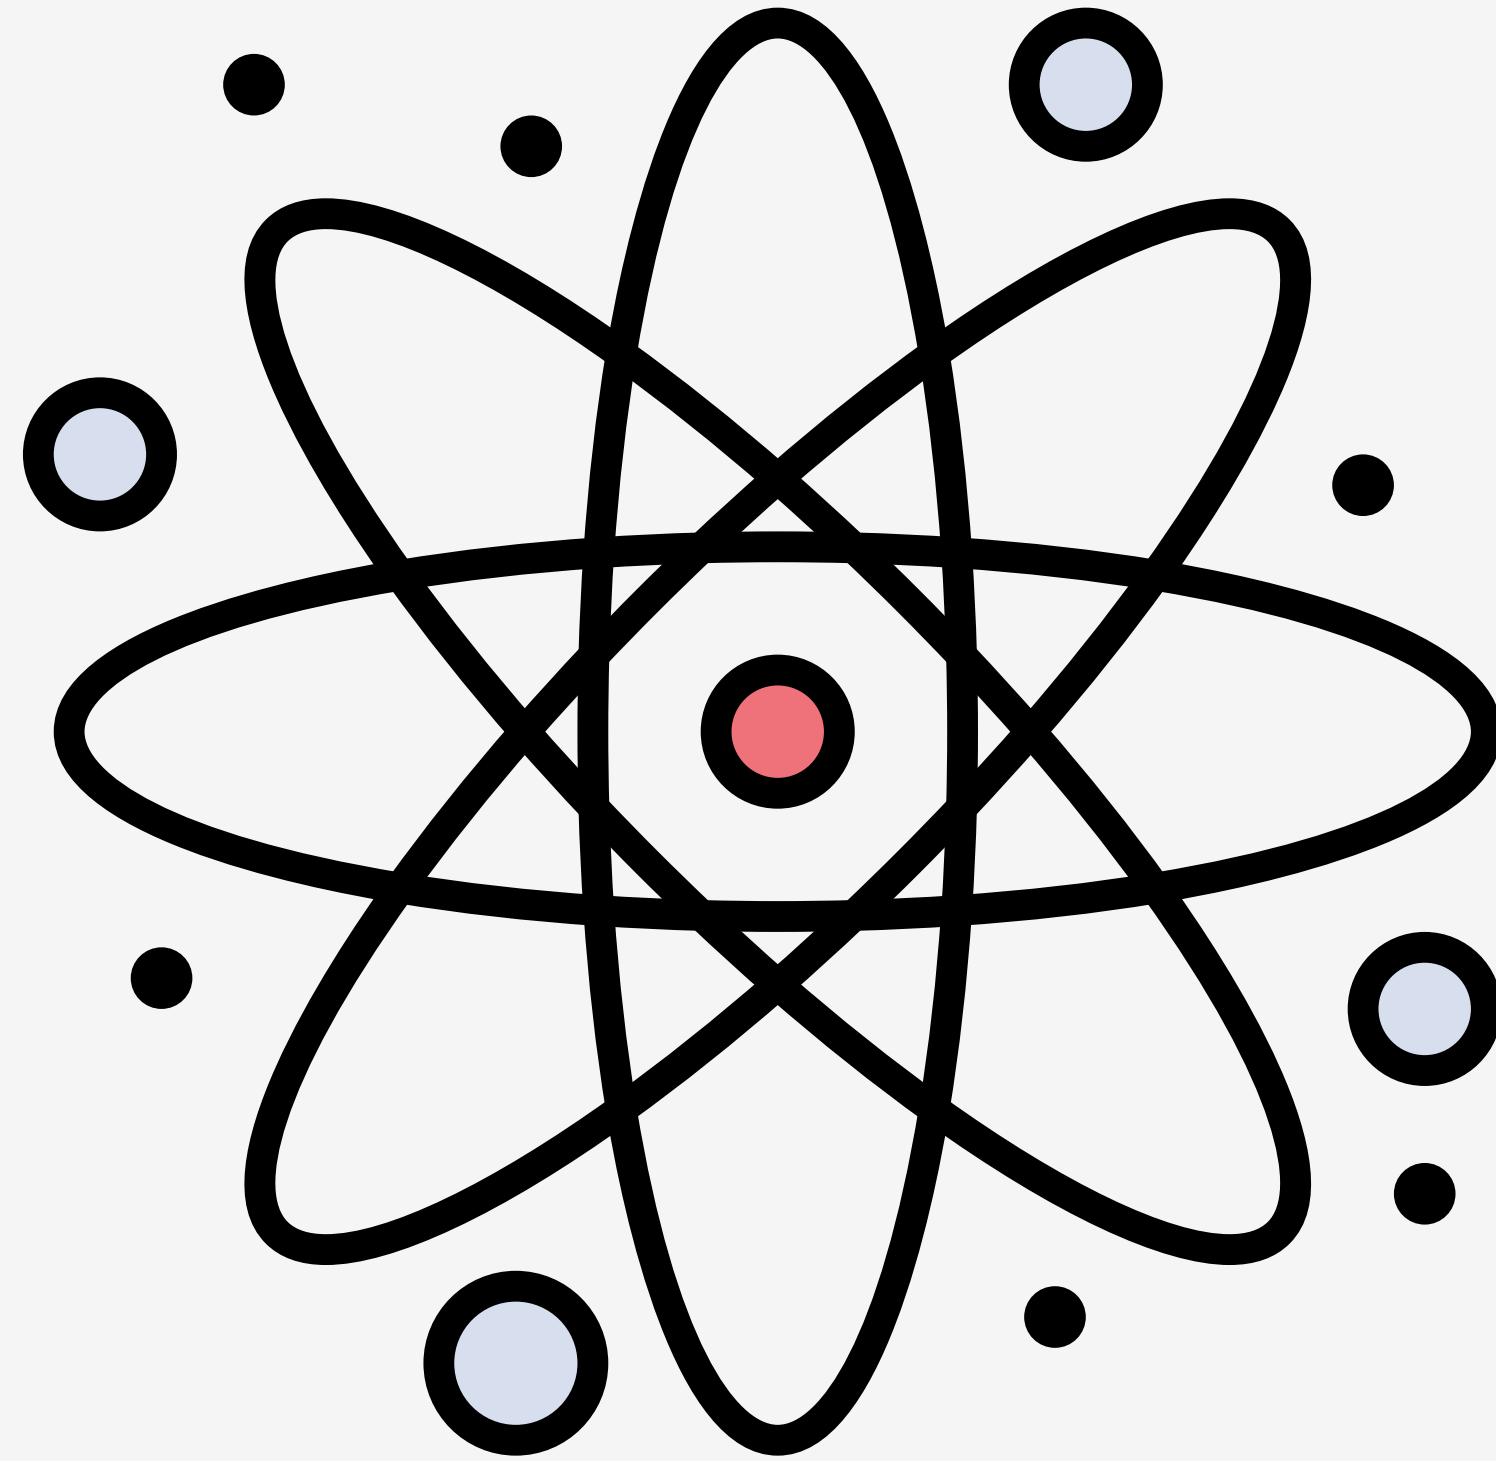

# WEBP

- Competitor to JPEG
- *NOT* universally supported
- Lossy and Lossless compression
- Future support for transparency and animation
- Maintains very small file size
- Used for photography

---

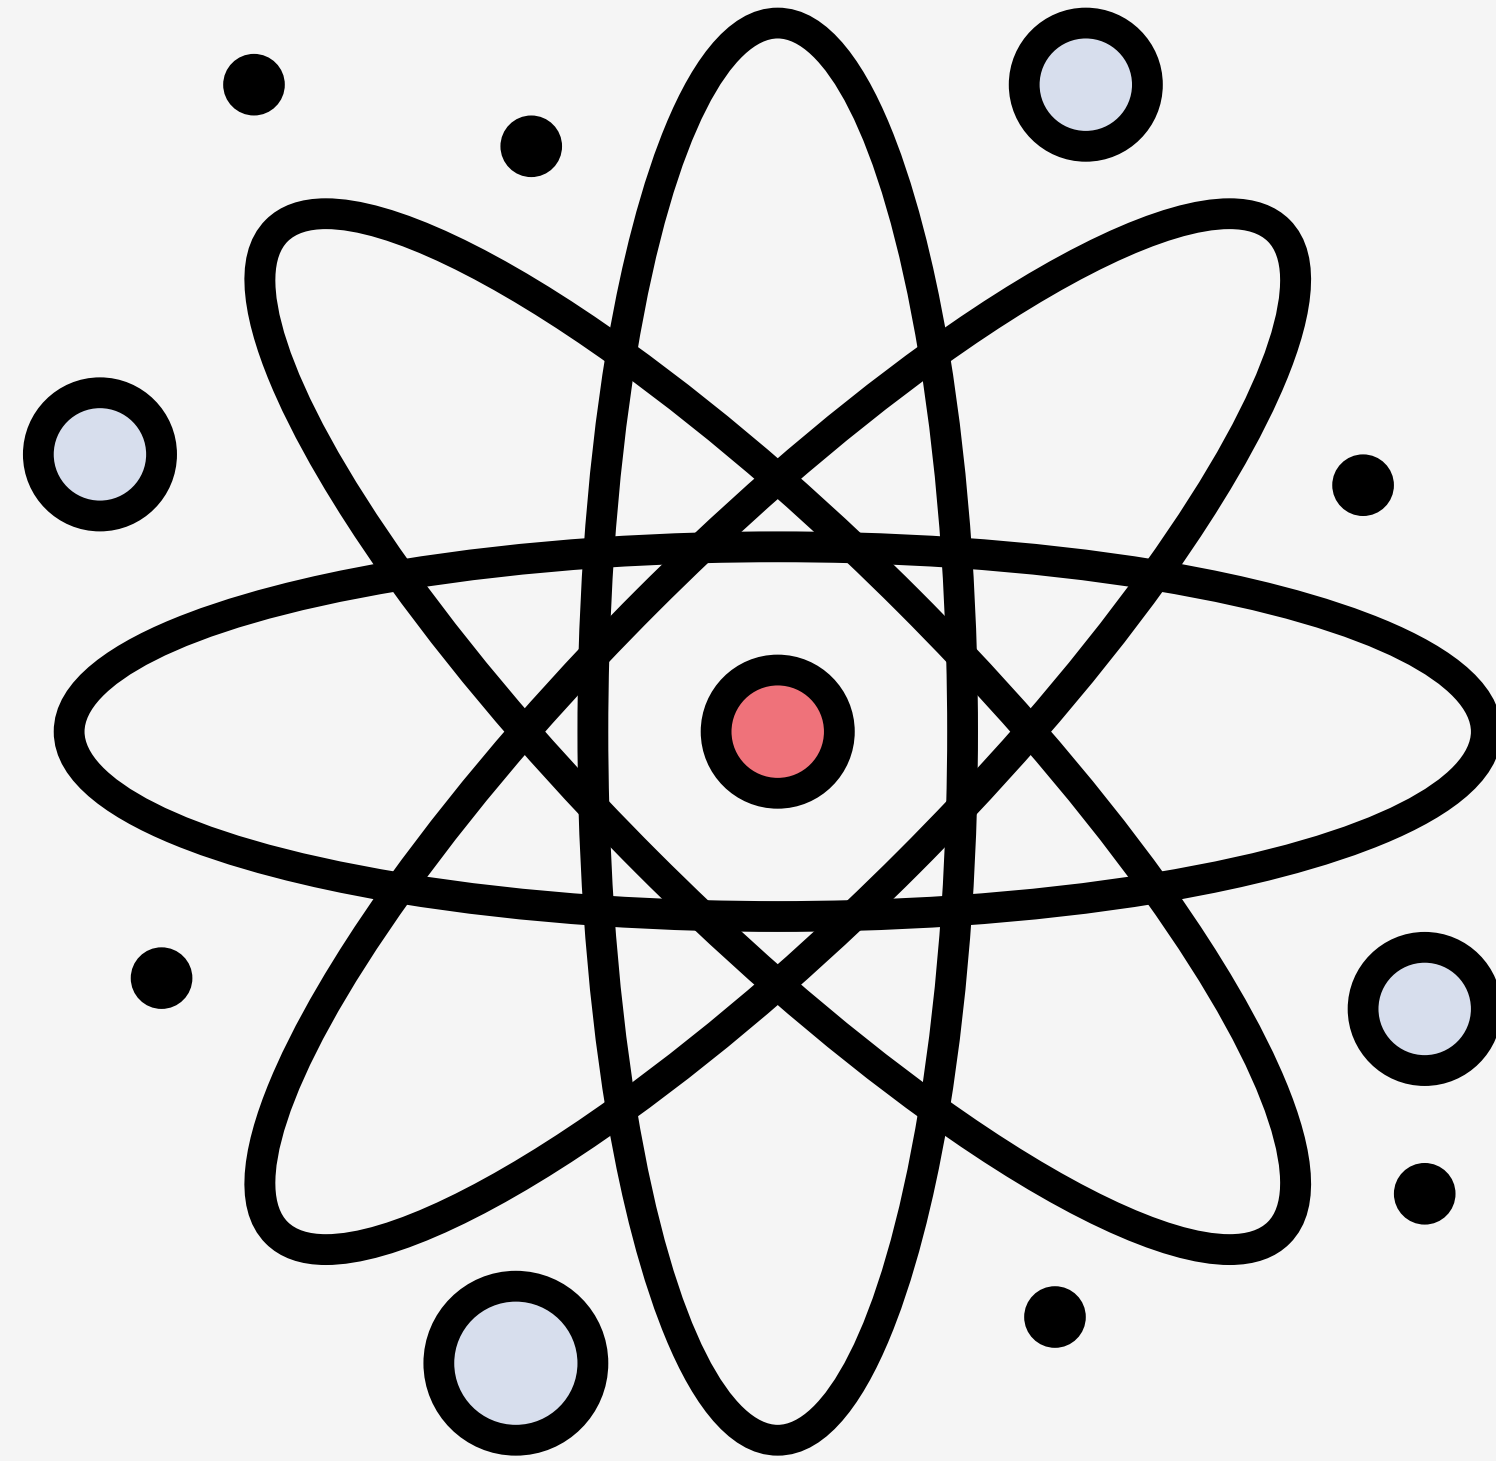

# VECTOR IMAGES

- **Vector Images** are created using lines, points, and polygons to represent an image
- **Vector images** are resolution-independent
- **Vector images** work best for images consisting of simple geometric shapes like icons or logos
- Common formats: SVG

---

# SCALABLE VECTOR GRAPHICS (SVG)

- XML-based image format
- SVG mark-up can directly inserted into HTML
- Can be manipulated with CSS and JavaScript
- Resolution independent
- Can be minified
- Used for simple graphics

---

# COMPRESSION

- Lossy compression
  - Eliminate pixels data
  - Quality loss
  - Significant size decrease
- Lossless compression
  - Compresses the pixel data
  - Maintains quality
  - Less significant size decrease

---

# RESOLUTION

- The higher resolution, the larger file size
- Avoid wasting pixels
- Higher resolution screens will require larger images

1x			
320px			
640px			
960px			
1280px			

1x	2x		
320px	640px

# RESPONSIVE IMAGES

---

# CSS SIZING

- Images by default are inline and will take the space they need
- CSS can be applied to make the image respond to the size of the parent

# CSS SIZING

```
<div class="image-container">  
    
</div>
```

---

```
img {  
  display: block;  
  max-width: 100%;  
}
```

# SRCSET

- The **srcset** attribute defined a list of images
- Each image should include the related size or the pixel density
- The browser will determine which image to use based on the viewport size and screen resolution

# SRCSET

```
<!-- sizes -->  

```

```
<!-- density -->  

```

# SIZES

- The **sizes** defines the size of the image at each viewport size
- Each image size is defined with the appropriate media query
- Image sizes can in fixed units, like **px**, or relative units, like **vw**.
- If no sizes attribute is included, the browser will assume **100vw**.

# SIZES

```

```

# PICTURE

- The `<picture>` element, along with the `<source>`, can be used to display different types of images
- The `<picture>` element can be used to provide images of different formats or different aspect ratios
- A media attribute, applied to the `<source>` tag, takes the media queries for when to use the specific source
- An `<img>` element should always be included inside a `<picture>` element

# PICTURE

```
<picture>
  <source srcset="img/books-400.jpg 400w,
                img/books-800.jpg 800w,
                img/books-1200.jpg 1200w"
        media="(max-width: 960px)">

  <source srcset="img/books-square-400.jpg 400w,
                img/books-square-600.jpg 600w,
                img/books-square-800.jpg 800w,"
        sizes="50vw"
        media="(min-width: 961px)">
  
</picture>
```

---

# PICTURE THIS!

- Download the starter files
- Update the HTML and CSS to make the image responsive and match the provided screenshots
- Post to your GitHub Pages
- *DUE:* Tue. Feb 4 @ 11:59 PM

---

# NEXT TIME...

- Work period (No Lecture)
- Landing Page - ***DUE THURSDAY***
